

The Barracuda Backup Service is an affordable, integrated local and offsite data backup solution, combining an onsite appliance with a monthly subscription plan. Data is replicated to two offsite locations, providing both onsite backups for the fastest restore times as well as secure offsite storage for disaster recovery.

1 Getting Started

This guide provides you with setup instructions for the Barracuda Backup Service. We recommend reading these instructions fully before starting the setup. To initiate your Barracuda Backup Service, you will need the following:

- Barracuda Backup Server
- AC power cable
- Ethernet cables
- Barracuda Backup Server serial number and linking code (on right)
- Connectivity and access information for servers to backup

2 Physical Installation

To install the Barracuda Backup Server:

1. Fasten the Barracuda Backup Server to a 19-inch rack or place it in a stable location.
2. Connect an ethernet cable from your network switch to the WAN ethernet port on the back panel of the Barracuda Backup Server.
3. Press the POWER button on the front panel to turn the unit on.

3 Optional IP Address and Network Settings Configuration

If your Barracuda Backup Server is located behind a corporate firewall, you may need to open the following ports to allow communication between the Barracuda Backup Server and the Internet:

- Port 1194 outbound for both TCP and UDP traffic. The Barracuda Backup Server uses port 1194 to transfer data over the Internet to the offsite storage location. If you would like to restrict the outbound

network traffic on port 1194 to only reach the Barracuda Central offsite servers, please contact Barracuda Networks Technical Support.

- Port 80 for both TCP and UDP traffic. The Barracuda Backup Server uses port 80 as a fail over in the event that it cannot connect via Port 1194.

By default, your Barracuda Backup Server is configured to obtain an IP address on your network using DHCP. If you need to specify a static IP, you can use the console administration interface by connecting a monitor and keyboard to the Barracuda Backup Server. Instructions for using the console administration interface can be found online at <http://backup.barracuda.com> under the **Support** tab. If DHCP is acceptable, proceed to Step 4.

4 Linking your Barracuda Backup Server

Your Barracuda Backup Server needs to be linked in your Barracuda Backup Account before you can activate your subscription plan and initiate data backups.

1. Go to <http://backup.barracuda.com> and log in. If you do not already have an account, click **Create a new account** under the Username field, follow the account creation instructions and log in.
2. Once logged in, click **Link a Barracuda Backup Server** on the left of the page or in the Account tab.
3. On the **Validation** page, enter the serial number and the linking code for your Barracuda Backup Server from the sticker below and click **Continue**.
4. Complete the form and choose your storage subscription plan.

5 Verify Connection to Barracuda Central

The Barracuda Backup Server you have just installed, powered on and linked should be listed on the left with a green status light to the right of its name. If the status of your Barracuda Backup Server is green, please continue on to the next step. Otherwise, please call Barracuda Networks Technical Support or consult Step 3 to fix the network settings and connectivity for your backup server.

6

Configure Backup Source Devices

Follow these instructions to setup servers which are located on the same network as your Barracuda Backup Server as backup sources.

1. Login at <http://backup.barracuda.com>.
2. Select the Backup Server on the left you want to setup.
3. Go to the **Backup** tab and choose **Sources**.
4. Click **Add Computer** at the top left to add a backup source.
5. Enter the following information regarding this backup source:
 - **Computer Description**, for identification purposes only.
 - **Computer Hostname** or **IP address**. The values must be resolvable on your local network.
 - **Computer Type** of the backup source.
 - The **connection information** requested based on the Server Type you chose. For Windows servers, you will need to enter the username (include "domain\" if the server is part of a Windows domain) and password for the Barracuda Backup Server to use to make a SMB/CIFS network connection to the server in order to access your data.
6. Click **Save Changes**.

Repeat steps 6.3 through 6.6 for every server that you want to back up.

7

Configure Direct Backup Data Sources (NAS Data Shares)

Follow these instructions in the Barracuda Backup Web interface to identify the data shares on your servers that are to be directly backed up by the Barracuda Backup Server.

1. Select the Backup Server on the left you want to setup.
2. Go to the **Backup** tab and choose **Sources**.
3. Click **Add Data Source** to the right of the Backup Source Device.
4. Enter a description of this Data Source that will help you easily identify it in your sources list and backup reports.
5. Choose data type **File Share** for this type of backup.
6. Enter the exact name of the Share on your server needed to access this Data Source from devices on the local network. You can test Share connectivity using the Test Share button to the right of this field.
7. Choose a default user access policy for the backups of this Data Source.
8. You can optionally select specific folders under the Share as your Data Source if you do not wish to backup the entire Share.
9. Click **Save Changes**.

Repeat this process for each data share that you want to add as a Data Source.

8

Configure Agent Backup Data Sources (Exchange, MS-SQL, System State)

Follow these instructions in the Barracuda Backup Web interface to identify the Data Source to be backed up by the Barracuda Backup Server using the Barracuda Backup Agent.

1. The Barracuda Backup Agent software must be installed on the Windows server that is configured as the Data Source Device. This software can be found in the Software Download section under the **Support** tab.
2. Select the Backup Server on the left you want to setup.
3. Go to the **Backup** tab and choose **Sources**.
4. Click **Add Data Source** to the right of the Backup Source Device.
5. Enter a description of this Data Source that will help you easily identify it in your sources list and backup reports.
6. Choose either the **Exchange Server**, **MS-SQL Server** or **Windows System State** data type for what you want to backup.
7. You can test connectivity between the Barracuda Backup Agent installed on your Backup Source Device and your Barracuda Backup Server using the Test Software Connectivity button.
8. Choose a default user access policy for the backups of this Data Source.
9. You can optionally select specific storage groups on your Exchange Server to backup or databases on your MS-SQL Server to backup.
10. Click **Save Changes**.

Repeat this process for each agent source you want to add as a Data Source.

9

Add Backup Schedules

Follow these instructions in the Barracuda Backup Web interface to establish your Backup Schedules.

1. Select the Backup Server on the left you want to setup.
2. Go to the **Backup** tab and choose **Schedules**.
3. Click **Add a Schedule** at the top left of the page.
4. Enter a descriptive schedule name for your future reference. The schedule name is a short description of when this schedule will run.
5. Check each day you want this backup schedule to run.
6. Indicate the time when you would like a backup to be run on the days you have selected above. Optionally, you can also repeat the backup process at a certain interval throughout the day to achieve continuous protection.

Note: Your initial backup will take some time to complete. You can view the status of your backups in the Reports section under the Backup tab of your Barracuda Backup Account.
